## Exterior Angles of a Triangle

An exterior angle of a triangle is equal in measure to the sum of the two non-adjacent interior angles of the triangle

In the triangle to the right,  $\angle 4$  is an exterior angle, because it is formed by a side of the triangle and an extension of another side.

The theorem above states that because  $\angle 4$  is an exterior angle, its measure is equal to the sum of the measures of the 2 interior angles to which it is not adjacent, namely,  $\angle 2$  and  $\angle 3$ .

$$m\angle 4 = m\angle 2 + m\angle 3$$

# I Examples

- ① In the accompanying diagram of  $\triangle ABC$ ,  $\overline{CA}$  is extended to D,  $m\angle ABC = 70^\circ$ , and  $m\angle BCA = 50^\circ$ . Find  $m\angle DAB$ .

- ③ In the accompanying diagram,  $m\angle A = (x + 20)^\circ$ ,  $m\angle B = 3x^\circ$ ,  $\angle BCD$  is an exterior angle formed by extending  $\overline{AC}$  to point D, and  $m\angle BCD = 120^\circ$ . Find the value of  $x$ .

- ② In the accompanying diagram,  $\overline{AC}$  is extended from C through D,  $m\angle BCD = 140^\circ$ , and  $m\angle B = 80^\circ$ . Find  $m\angle BAC$ .

- ④ In the accompanying diagram, the measure of exterior angle CBD is  $110^\circ$ . If the measures of the two nonadjacent interior angles are represented by  $3x^\circ$  and  $2x^\circ$ , find the value of  $x$ .

Use the Exterior Angles Theorem to find the measure of each angle in degrees.

5

$m\angle C =$  \_\_\_\_\_

$m\angle D =$  \_\_\_\_\_

$m\angle DEC =$  \_\_\_\_\_

6

$m\angle L =$  \_\_\_\_\_

$m\angle MKL =$  \_\_\_\_\_

$m\angle MKJ =$  \_\_\_\_\_

More Practice: In each triangle below, solve for x.
